

Glutamine And Glutamate In Mammals

by Eling Kvamme

Overview of glutamine and glutamate metabolism in mammalian cells. Glutamate is produced from glutamine through glutaminase activity. Glutamate can then be converted to glutamine. Four of the amino acids: glutamate, aspartate, alanine and glutamine are present in mammalian cells at much higher concentrations than the other 16. All four amino acids are involved in the synthesis of glutamine. Glutamine and Glutamate in Metabolism - Journal of Nutrition On Line Monitoring Of Glucose, Lactate, Glutamine, And Glutamate .
